Ventilácia - 3 kompartmenty

Návod k programu ventilacia_3k.R

Ondrej Pisarčík

23 novembra 2018

Určenie programu

Program $ventilacia_3k.R$ slúži pre výpočet priemernej výmeny vzduchu medzi budovou a vonkajším prostredím n, ďalej toky vzduchu $R_{i,j}$ pre $i,j \in \{1,2,3\}$ medzi jednotlivými zónami, exfiltrácie vzduchu Re_i pre $i \in \{1,2,3\}$ z jednotlivých zón a odhadov ich neistôt. Program je určený pre trojkompartmentový model ventilácie.

Programovací jazyk

Program je napísaný v prostredí R. Aby spustiť program $ventilacia_3k.R$ je potrebné mať nainštalované uvedené prostredie. Doporučovaným GUI pre R je RStudio.

Program *ventilacia_3k.R* okrem funkcií implementovaných v základnej verzii *R* využíva i dodatočné balíčky *tidyverse* a *Deriv*. Uvedené balíčky možno nainštalovať pomocou príkazov **install.packages("tidyverse")** a **install.packages("Deriv")**.

Popis programu

Celý kód programu je uvedený na konci tohto dokumentu. Kód je rozdelený na tri hlavné časti:

- 1. načítanie potrebných balíčkov
- 2. vstupné parametre
- 3. algoritmus výpočtu

V prvej časti program sa načítavajú potrebné balíčky, v druhej sa zadávajú vstupné parametre (viď kód programu na konci dokumentu) a v tretej časti sa nachádza kód pre výpočet požadovaných veličín. V prvom a tretom bloku sa nič neprepisuje.

Práca s programom v *RStudio*

Po spustení RStudio možno otvoriť program dvomi spôsobmi

- pomocou hornej lišty (File Open File)
- pomocou klávesnicovej skratky lavý Ctrl + O

Vstupy sa zapisujú do vektorov. Vektor v R sa definuje pomocou príkazu c(). Jednotlivé prvky vektoru sa oddeľujú čiarkou. Pokiaľ vstupom nie je vektor hodnôt, ale len jedna hodnota (napr. doba merania), hodnotu zapíšeme bez použitia znakov c(). Pre desatinnú čiarku sa používa bodka.

Vstupné parametre *tlak*, *teplota*, *molárna hmotnosť*, *odberová rýchlosť* a *odozva detektora* sa zadávajú v takom poradí, aby bola zachovaná následujúca postupnosť výpočtu hmotnostných koncentrácií i-tého typu indikačného plynu v j-tej zóne:

• C11, C21, C31, C12, C22, C32, C13, C23, C33

Parametre emisia indikačných plynov a objemy zón sa zadávajú podľa číslovania zón.

Po zadaní všetkých potrebných vstupných parametrov spustíme program z hornej lišty tlačítkom Source alebo skratkou ľavý Ctrl + pravý Shift + Enter.

Tabuľka s výsledkami bude vypísaná v prostredí *RStudio* v okne *Console*. Okrem toho výsledky budú uložené v priečinku so súborom, ktorý bude zadaný vstupným parametrom *cesta*.

Kód programu

```
# 1. NACITANIE POTREBNYCH BALICKOV (Nic neprepisovat!)
rm(list = ls())
library(tidyverse)
library(Deriv)
# 2. VSTUPNE PARAMETRE (Zadava uzivatel)
# -----
# vstupne paramere zadavame v tomto poradi: C11, C21, C31, C12, C22, C32, C13, C23, C33
# doba merania
Texp = 10080
# tlak
p <- c(99000, 99000, 99000)
# teplota v stupnoch celsia
